

The optimal cost on the time interval  $[T_1, \infty]$  is quadratic:

$$x^{T}Sx = \min_{\mathbf{u}} \int_{T_{1}}^{\infty} \begin{pmatrix} \mathbf{x} \\ \mathbf{u} \end{pmatrix}^{T} \begin{pmatrix} Q_{1} & Q_{12} \\ Q_{12}^{T} & Q_{2} \end{pmatrix} \begin{pmatrix} \mathbf{x} \\ \mathbf{u} \end{pmatrix} dt$$
when
$$\begin{cases} \dot{\mathbf{x}} = A\mathbf{x} + B\mathbf{u} \\ \mathbf{x}(T_{1}) = x \end{cases}$$

An optimal trajectory on the time interval  $[T_1, T]$  must be optimal also on each of the subintervals  $[T_1, T_1 + \epsilon]$  and  $[T_1 + \epsilon, T]$ .

# Lecture 9: Linear Quadratic Control Dynamic programming in linear quadratic control $\mathbf{x}(T_1) = x, \qquad \mathbf{x}(T_1 + \epsilon) = x + (Ax + Bu)\epsilon$ Dynamic Programming $x^{T}Sx = \min_{\mathbf{u}} \int_{T_{1}}^{\infty} \begin{pmatrix} \mathbf{x} \\ \mathbf{u} \end{pmatrix}^{T} \begin{pmatrix} Q_{1} & Q_{12} \\ Q_{12}^{T} & Q_{2} \end{pmatrix} \begin{pmatrix} \mathbf{x} \\ \mathbf{u} \end{pmatrix} dt$ Riccati equation $= \min_{\mathbf{u}} \left\{ \begin{pmatrix} x \\ u \end{pmatrix}^T \begin{pmatrix} Q_1 & Q_{12} \\ Q_{12}^T & Q_2 \end{pmatrix} \begin{pmatrix} x \\ u \end{pmatrix} \epsilon + \int_{T_1+\epsilon}^{\infty} \begin{pmatrix} \mathbf{x} \\ \mathbf{u} \end{pmatrix}^T \begin{pmatrix} Q_1 & Q_{12} \\ Q_{12}^T & Q_2 \end{pmatrix} \begin{pmatrix} \mathbf{x} \\ \mathbf{u} \end{pmatrix} dt \right\}$ Optimal State Feedback Stability and Robustness $= \min_{\mathbf{u}} \left\{ \begin{pmatrix} x \\ u \end{pmatrix}^T \begin{pmatrix} Q_1 & Q_{12} \\ Q_{12}^T & Q_2 \end{pmatrix} \begin{pmatrix} x \\ u \end{pmatrix} \epsilon + \left[ x + (Ax + Bu)\epsilon \right]^T S \left[ x + (Ax + Bu)\epsilon \right] \right\}$ by definition of S. Neglecting $\epsilon^2$ gives **Bellman's equation**: $0 = \min_{u} \left[ \left( x^{T} Q_{1} x + 2x^{T} Q_{12} u + u^{T} Q_{2} u \right) + 2x^{T} S (Ax + Bu) \right]$ **Completion of squares** The Riccati Equation Completion of squares in Bellman's equation gives The scalar case: Suppose c > 0. $0 = \min\left(\left(x^{T}Q_{1}x + 2x^{T}Q_{12}u + u^{T}Q_{2}u\right) + 2x^{T}S(Ax + Bu)\right)$ $ax^{2} + 2bxu + cu^{2} = x\left(a - \frac{b^{2}}{c}\right)x + \left(u + \frac{b}{c}x\right)c\left(u + \frac{b}{c}x\right)$ $= \min \left( x^{T} [Q_{1} + A^{T}S + SA] x + 2x^{T} [Q_{12} + SB] u + u^{T} Q_{2} u \right)$ is minimized by $u = -\frac{b}{c}x$ . The minimum is $(a - b^2/c) x^2$ . $= x^{T} \Big( Q_{1} + A^{T}S + SA - (SB + Q_{12})Q_{2}^{-1}(SB + Q_{12})^{T} \Big) x$ The matrix case: Suppose $Q_{\mu} > 0$ . Then with minimum attained for $u = -Q_2^{-1}(SB + Q_{12})^T x$ . $x^T Q_x x + 2x^T Q_{xu} u + u^T Q_u u$ The equation $= (u + Q_{u}^{-1}Q_{xu}^{T}x)^{T}Q_{u}(u + Q_{u}^{-1}Q_{xu}^{T}x) + x^{T}(Q_{x} - Q_{xu}Q_{u}^{-1}Q_{xu}^{T})x$ $0 = Q_1 + A^T S + SA - (SB + Q_{12})Q_2^{-1}(SB + Q_{12})^T$ is minimized by $u = -Q_u^{-1}Q_{xu}^T x$ . The minimum is $x^T(Q_x - Q_{xu}Q_u^{-1}Q_{xu}^T)x.$ is called the algebraic Riccati equation Lecture 9: Linear Quadratic Control Jocopo Francesco Riccati, 1676–1754 Dynamic Programming Riccati equation Optimal State Feedback Stability and Robustness Linear Quadratic Optimal Control Example: First order system Problem: For $\dot{x}(t) = u(t), x(0) = x_0$ , $\int_{0}^{\infty} \left( x(t)^{T} Q_{1} x(t) + 2x(t)^{T} Q_{12} u(t) + u(t)^{T} Q_{2} u(t) \right) dt$ Minimize $\int_0^\infty \left\{ x(t)^2 + \rho u(t)^2 \right\} dt$ Minimize subject to $\dot{x} = Ax(t) + Bu(t), \quad x(0) = x_0$ $0 = 1 - S^2 / \rho \quad \Rightarrow \quad S = \sqrt{\rho}$ Riccati equation $L = S/\rho = 1/\sqrt{\rho} \quad \Rightarrow \quad u = -x/\sqrt{\rho}$ Controller **Solution:** Assume (A, B) controllable. Then there is a unique Closed loop system $\dot{x} = -x/\sqrt{\rho} \Rightarrow x = x_0 e^{-t/\sqrt{\rho}}$ S > 0 solving the Riccati equation $0 = Q_1 + A^T S + SA - (SB + Q_{12})Q_2^{-1}(SB + Q_{12})^T$ $\int_0^\infty \left\{ x^2 + \rho u^2 \right\} dt = x_0^T S x_0 = x_0^2 \sqrt{\rho}$ Optimal cost The optimal control law is u = -Lx with $L = Q_2^{-1}(SB + Q_{12})^T$ . The minimal value is $x_0^T S x_0$ . What values of $\rho$ give the fastest response? Why? What values of $\rho$ give smallest optimal cost? Why? **Remark:** The feedback gain L does not depend on $x_0$

# Lecture 9: Linear Quadratic Control

# Theorem: Stability of the closed-loop system

Assume that

$$Q=egin{pmatrix} Q_1&Q_{12}\ Q_{12}^T&Q_2 \end{pmatrix}$$

is positive definite and that there exists a positive-definite steady-state solution *S* to the algebraic Riccati equation. Then the optimal controller u(t) = -Lx(t) gives an asymptotically stable closed-loop system  $\dot{x}(t) = (A - BL)x(t)$ .

Proof:

$$\begin{aligned} \frac{d}{dt}x(t)^T Sx(t) &= 2x^T S \dot{x} = 2x^T S (Ax + Bu) \\ &= -\left(x^T Q_1 x + 2x^T Q_{12} u + u^T Q_2 u\right) < 0 \text{ for } x(t) \neq 0 \end{aligned}$$

Hence  $x(t)^T S x(t)$  is decreasing and tends to zero as  $t \to \infty$ .

## **Example – Double integrator**

$$A = \begin{pmatrix} 0 & 1 \\ 0 & 0 \end{pmatrix} \quad B = \begin{pmatrix} 0 \\ 1 \end{pmatrix} \quad Q_1 = \begin{pmatrix} 1 & 0 \\ 0 & 0 \end{pmatrix} \quad Q_2 = \rho \quad x(0) = \begin{pmatrix} 1 \\ 0 \end{pmatrix}$$
  
States and inputs (dotted) for  $\rho = 0.01$ ,  $\rho = 0.1$ ,  $\rho = 1$ ,  $\rho = 10$ 

# **Proof of stability robustness**

Using the Riccati equation

$$0 = Q_1 + A^T S + SA - L^T Q_2 L \qquad L = Q_2^{-1} (SB + Q_{12})^T$$

it is straightforward to verify that

$$\begin{bmatrix} I + L(i\omega - A)^{-1}B \end{bmatrix}^* Q_2 \begin{bmatrix} I + L(i\omega - A)^{-1}B \end{bmatrix} = \begin{bmatrix} (i\omega - A)^{-1}B \end{bmatrix}^* \begin{bmatrix} Q_1 & Q_{12} \\ Q_{12}^* & Q_2 \end{bmatrix} \begin{bmatrix} (i\omega - A)^{-1}B \\ I \end{bmatrix}$$
  
In particular, with  $Q_1 > 0$ ,  $Q_{12} = 0$ ,  $Q_2 = \rho > 0$   
 $\begin{bmatrix} 1 + L(i\omega - A)^{-1}B \end{bmatrix}^* \rho \begin{bmatrix} 1 + L(i\omega - A)^{-1}B \end{bmatrix} = B^T [(i\omega - A)^{-1}]^* Q_1(i\omega - A)^{-1}B + \rho$   
 $> \rho$ 

Dividing by  $\rho$  gives

$$|1 + L(i\omega - A)^{-1}B| \ge 1$$

Stability and Robustness

Riccati equation

 $\ensuremath{\texttt{LQRD}}$  solves the corresponding discrete time problem

### Stability robustness of optimal state feedback

Notice that the distance from  $L(i\omega I - A)^{-1}B$  to -1 is never smaller than 1. This is always true(!) for linear quadratic optimal state feedback when  $Q_1 > 0$ ,  $Q_{12} = 0$  and  $Q_2 = \rho > 0$  is scalar. Hence the phase margin is at least  $60^{\circ}$ .
